Abstract

In this paper, the boundedness properties of vector-valued intrinsic square functions and their vector-valued commutators with $BMO(\mathbb{R}^n)$ functions are discussed. We first show the weighted strong type and weak type estimates of vector-valued intrinsic square functions in the Morrey type spaces. Then we obtain weighted strong type estimates of vector-valued analogues of commutators in Morrey type spaces. In the endpoint case, we establish the weighted weak $L \log L$ -type estimates for these vector-valued commutators in the setting of weighted Lebesgue spaces. Furthermore, we prove weighted endpoint estimates of these commutator operators in Morrey type spaces. In particular, we can obtain strong type and endpoint estimates of vector-valued intrinsic square functions and their commutators in the weighted Morrey spaces and the generalized Morrey spaces.

Keywords: Vector-valued intrinsic square functions; Morrey type spaces; vector-valued commutators; A_p weights

1 Introduction

The intrinsic square functions were first introduced by Wilson in [18,19]; they are defined as follows. For $0 < \alpha \leq 1$, let $\mathcal{C}_\alpha$ be the family of functions $\varphi : \mathbb{R}^n \mapsto \mathbb{R}$ such that φ 's support is contained in $\{x \in \mathbb{R}^n : |x| \leq 1\}$, $\int_{\mathbb{R}^n} \varphi(x) dx = 0$, and for all $x, x' \in \mathbb{R}^n$,

$$|\varphi(x) - \varphi(x')| \leq |x - x'|^\alpha.$$

For $(y, t) \in \mathbb{R}_+^{n+1} = \mathbb{R}^n \times (0, +\infty)$ and $f \in L_{loc}^1(\mathbb{R}^n)$, we set

$$A_\alpha(f)(y, t) = \sup_{\varphi \in \mathcal{C}_\alpha} |\varphi_t * f(y)| = \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} \varphi_t(y - z) f(z) dz \right|,$$

*E-mail address: wanghua@pku.edu.cn.

where φ_t denotes the usual L^1 dilation of φ : $\varphi_t(y) = t^{-n}\varphi(y/t)$. Then we define the intrinsic square function of f (of order α) by the formula

$$\mathcal{S}_\alpha(f)(x) := \left(\iint_{\Gamma(x)} \left(A_\alpha(f)(y, t) \right)^2 \frac{dy dt}{t^{n+1}} \right)^{1/2}, \quad (1.1)$$

where $\Gamma(x)$ denotes the usual cone of aperture one:

$$\Gamma(x) := \{(y, t) \in \mathbb{R}_+^{n+1} : |x - y| < t\}.$$

This new function is independent of any particular kernel, and it dominates pointwise the classical square function (Lusin area integral) and its real-variable generalizations, one can see more details in [18, 19]. Let $\vec{f} = (f_1, f_2, \dots)$ be a sequence of locally integrable functions on $\mathbb{R}^n$. For any $x \in \mathbb{R}^n$, Wilson [19] also defined the vector-valued intrinsic square functions of $\vec{f}$ by

$$\mathcal{S}_\alpha(\vec{f})(x) := \left(\sum_{j=1}^{\infty} |\mathcal{S}_\alpha(f_j)(x)|^2 \right)^{1/2}. \quad (1.2)$$

In [19], Wilson has established the following two results.

Theorem A ([19]). *Let $0 < \alpha \leq 1$, $1 < p < \infty$ and $w \in A_p$ (Muckenhoupt weight class). Then there exists a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{L_w^p} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L_w^p}.$$

Theorem B ([19]). *Let $0 < \alpha \leq 1$ and $p = 1$. Then for any given weight function w and $\lambda > 0$, there exists a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ and $\lambda > 0$ such that*

$$w \left(\left\{ x \in \mathbb{R}^n : \left(\sum_j |\mathcal{S}_\alpha(f_j)(x)|^2 \right)^{1/2} > \lambda \right\} \right) \leq \frac{C}{\lambda} \int_{\mathbb{R}^n} \left(\sum_j |f_j(x)|^2 \right)^{1/2} M(w)(x) dx,$$

where M denotes the standard Hardy–Littlewood maximal operator.

If we take $w \in A_1$, then $M(w)(x) \leq C \cdot w(x)$ for a.e. $x \in \mathbb{R}^n$ by the definition of A_1 weight (see Section 2). Hence, as a straightforward consequence of Theorem B, we obtain

Theorem B. *Let $0 < \alpha \leq 1$, $p = 1$ and $w \in A_1$. Then there exists a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{WL_w^1} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L_w^1}.$$

Let b be a locally integrable function on $\mathbb{R}^n$ and $0 < \alpha \leq 1$, the commutators generated by b and intrinsic square functions $\mathcal{S}_\alpha$ are defined by the following expression in [16].

$$[b, \mathcal{S}_\alpha](f)(x) := \left(\iint_{\Gamma(x)} \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} [b(x) - b(z)] \varphi_t(y - z) f(z) dz \right|^2 \frac{dy dt}{t^{n+1}} \right)^{1/2}. \quad (1.3)$$

In this paper, we will consider the vector-valued analogues of these commutator operators. Let $\vec{f} = (f_1, f_2, \dots)$ be a sequence of locally integrable functions on $\mathbb{R}^n$. For any $x \in \mathbb{R}^n$, in the same way, we can define the commutators for vector-valued intrinsic square functions of $\vec{f}$ as

$$[b, \mathcal{S}_\alpha](\vec{f})(x) := \left(\sum_{j=1}^{\infty} |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{1/2}. \quad (1.4)$$

On the other hand, the classical Morrey space was originally introduced by Morrey in [8] to study the local behavior of solutions to second order elliptic partial differential equations. Since then, this space played an important role in studying the regularity of solutions to partial differential equations. In [7], Mizuhara introduced the generalized Morrey space $L^{p,\Theta}(\mathbb{R}^n)$ which was later extended and studied by many authors. In [6], Komori and Shirai defined a version of the weighted Morrey space $L^{p,\kappa}(w)$ which is a natural generalization of weighted Lebesgue space. Recently, in [17], we have established the strong type and weak type estimates for vector-valued intrinsic square functions on $L^{p,\Theta}(\mathbb{R}^n)$ and $L^{p,\kappa}(w)$.

The main purpose of this paper is twofold. We first define a new kind of Morrey type spaces $\mathcal{M}^{p,\theta}(w)$ containing generalized Morrey space $L^{p,\Theta}(\mathbb{R}^n)$ and weighted Morrey space $L^{p,\kappa}(w)$ as special cases, and then we will discuss the boundedness properties of vector-valued intrinsic square functions (1.2) and vector-valued commutators (1.4) defined above in these Morrey type spaces $\mathcal{M}^{p,\theta}(w)$ for all $1 \leq p < \infty$.

2 Main results

2.1 Notations and preliminaries

A weight w will always mean a positive function which is locally integrable on $\mathbb{R}^n$, $B = B(x_0, r_B) = \{x \in \mathbb{R}^n : |x - x_0| < r_B\}$ denotes the open ball centered at x_0 and with radius $r_B > 0$. For $1 < p < \infty$, a weight function w is said to belong to the Muckenhoupt's class A_p , if there is a constant $C > 0$ such that for every ball $B \subseteq \mathbb{R}^n$ (see [4, 9]),

$$\left(\frac{1}{|B|} \int_B w(x) dx \right)^{1/p} \left(\frac{1}{|B|} \int_B w(x)^{-p'/p} dx \right)^{1/p'} \leq C,$$

where p' is the dual of p such that $1/p + 1/p' = 1$. For the case $p = 1$, $w \in A_1$, if there is a constant $C > 0$ such that for every ball $B \subseteq \mathbb{R}^n$,

$$\frac{1}{|B|} \int_B w(x) dx \leq C \cdot \operatorname{ess\,inf}_{x \in B} w(x).$$

We also define $A_\infty = \bigcup_{1 \leq p < \infty} A_p$. It is well known that if $w \in A_p$ with $1 \leq p < \infty$, then for any ball B , there exists an absolute constant $C > 0$ such that

$$w(2B) \leq C \cdot w(B). \quad (2.1)$$

In general, for $w \in A_1$ and any $j \in \mathbb{Z}_+$, there exists an absolute constant $C > 0$ such that (see [4])

$$w(2^j B) \leq C \cdot 2^{jn} w(B). \quad (2.2)$$

Moreover, if $w \in A_\infty$, then for all balls B and all measurable subsets E of B , there exists a number $\delta > 0$ independent of E and B such that (see [4])

$$\frac{w(E)}{w(B)} \leq C \left(\frac{|E|}{|B|} \right)^\delta. \quad (2.3)$$

A weight function w is said to belong to the reverse Hölder class RH_r , if there exist two constants $r > 1$ and $C > 0$ such that the following reverse Hölder inequality holds for every ball $B \subseteq \mathbb{R}^n$.

$$\left(\frac{1}{|B|} \int_B w(x)^r dx \right)^{1/r} \leq C \left(\frac{1}{|B|} \int_B w(x) dx \right).$$

Given a ball B and $\lambda > 0$, λB denotes the ball with the same center as B whose radius is λ times that of B . For a given weight function w and a measurable set E , we also denote the Lebesgue measure of E by $|E|$ and the weighted measure of E by $w(E)$, where $w(E) = \int_E w(x) dx$. Equivalently, we could define the above notions with cubes instead of balls. Hence we shall use these two different definitions appropriate to calculations.

Given a weight function w on $\mathbb{R}^n$, for $1 \leq p < \infty$, the weighted Lebesgue space $L_w^p(\mathbb{R}^n)$ is defined as the set of all functions f such that

$$\|f\|_{L_w^p} := \left(\int_{\mathbb{R}^n} |f(x)|^p w(x) dx \right)^{1/p} < \infty.$$

We also denote by $WL_w^1(\mathbb{R}^n)$ the weighted weak Lebesgue space consisting of all measurable functions f such that

$$\|f\|_{WL_w^1} := \sup_{\lambda > 0} \lambda \cdot w(\{x \in \mathbb{R}^n : |f(x)| > \lambda\}) < \infty.$$

We next recall some basic definitions and facts about Orlicz spaces needed for the proofs of the main results. For more information on the subject, one can see [14]. A function Φ is called a Young function if it is continuous, nonnegative,

convex and strictly increasing on $[0, +\infty)$ with $\Phi(0) = 0$ and $\Phi(t) \rightarrow +\infty$ as $t \rightarrow +\infty$. We define the Φ -average of a function f over a ball B by means of the following Luxemburg norm:

$$\|f\|_{\Phi, B} := \inf \left\{ \sigma > 0 : \frac{1}{|B|} \int_B \Phi \left(\frac{|f(x)|}{\sigma} \right) dx \leq 1 \right\}.$$

An equivalent norm that is often useful in calculations is as follows (see [10, 14]):

$$\|f\|_{\Phi, B} \leq \inf_{\eta > 0} \left\{ \eta + \frac{\eta}{|B|} \int_B \Phi \left(\frac{|f(x)|}{\eta} \right) dx \right\} \leq 2\|f\|_{\Phi, B}. \quad (2.4)$$

Given a Young function Φ , we use $\bar{\Phi}$ to denote the complementary Young function associated to Φ . Then the following generalized Hölder's inequality holds for any given ball B (see [10, 11]).

$$\frac{1}{|B|} \int_B |f(x) \cdot g(x)| dx \leq 2\|f\|_{\Phi, B} \|g\|_{\bar{\Phi}, B}.$$

In order to deal with the weighted case, for $w \in A_\infty$, we need to define the weighted Φ -average of a function f over a ball B by means of the weighted Luxemburg norm:

$$\|f\|_{\Phi(w), B} := \inf \left\{ \sigma > 0 : \frac{1}{w(B)} \int_B \Phi \left(\frac{|f(x)|}{\sigma} \right) w(x) dx \leq 1 \right\}.$$

It can be shown that for $w \in A_\infty$ (see [14, 20]),

$$\|f\|_{\Phi(w), B} \approx \inf_{\eta > 0} \left\{ \eta + \frac{\eta}{w(B)} \int_B \Phi \left(\frac{|f(x)|}{\eta} \right) w(x) dx \right\}, \quad (2.5)$$

and

$$\frac{1}{w(B)} \int_B |f(x) \cdot g(x)| w(x) dx \leq C \|f\|_{\Phi(w), B} \|g\|_{\bar{\Phi}(w), B}.$$

The young function that we are going to use is $\Phi(t) = t \cdot (1 + \log^+ t)$ with its complementary Young function $\bar{\Phi}(t) \approx \exp(t)$. Here by $A \approx B$, we mean that there exists a constant $C > 1$ such that $\frac{1}{C} \leq \frac{A}{B} \leq C$. In the present situation, we denote

$$\|f\|_{L \log L(w), B} = \|f\|_{\Phi(w), B}, \quad \|g\|_{\exp L(w), B} = \|g\|_{\bar{\Phi}(w), B}.$$

By the generalized Hölder's inequality with weight, we have (see [10, 20])

$$\frac{1}{w(B)} \int_B |f(x) \cdot g(x)| w(x) dx \leq C \|f\|_{L \log L(w), B} \|g\|_{\exp L(w), B}. \quad (2.6)$$

Let us now recall the definition of the space of $BMO(\mathbb{R}^n)$ (Bounded Mean Oscillation) (see [3, 5]). A locally integrable function b is said to be in $BMO(\mathbb{R}^n)$, if

$$\|b\|_* := \sup_B \frac{1}{|B|} \int_B |b(x) - b_B| dx < \infty,$$

where b_B stands for the average of b on B , i.e., $b_B = \frac{1}{|B|} \int_B b(y) dy$ and the supremum is taken over all balls B in $\mathbb{R}^n$. Modulo constants, the space $BMO(\mathbb{R}^n)$ is a Banach space with respect to the norm $\|\cdot\|_*$. By the John–Nirenberg’s inequality, it is not difficult to see that for any $w \in A_\infty$ and any given ball B (see [20]),

$$\|b - b_B\|_{\exp L(w), B} \leq C \|b\|_*. \quad (2.7)$$

2.2 Morrey type spaces

Definition 2.1 ([6]). *Let $1 \leq p < \infty$, $0 < \kappa < 1$ and w be a weight function on $\mathbb{R}^n$. Then the weighted Morrey space $L^{p,\kappa}(w)$ is defined by*

$$L^{p,\kappa}(w) := \left\{ f \in L_{loc}^p(w) : \|f\|_{L^{p,\kappa}(w)} = \sup_B \left(\frac{1}{w(B)^\kappa} \int_B |f(x)|^p w(x) dx \right)^{1/p} < \infty \right\},$$

where the supremum is taken over all balls B in $\mathbb{R}^n$. We also denote by $WL^{1,\kappa}(w)$ the weighted weak Morrey space of all measurable functions f such that

$$\sup_B \sup_{\lambda > 0} \frac{1}{w(B)^\kappa} \lambda \cdot w(\{x \in B : |f(x)| > \lambda\}) \leq C < \infty.$$

Let $\Theta = \Theta(r)$, $r > 0$, be a growth function, that is, a positive increasing function in $(0, +\infty)$ and satisfy the following doubling condition:

$$\Theta(2r) \leq D \cdot \Theta(r), \quad \text{for all } r > 0, \quad (2.8)$$

where $D = D(\Theta) \geq 1$ is a doubling constant independent of r .

Definition 2.2 ([7]). *Let $1 \leq p < \infty$ and Θ be a growth function in $(0, +\infty)$. Then the generalized Morrey space $L^{p,\Theta}(\mathbb{R}^n)$ is defined as the set of all locally integrable functions f for which*

$$\|f\|_{L^{p,\Theta}} := \sup_{r > 0; B(x_0, r)} \left(\frac{1}{\Theta(r)} \int_{B(x_0, r)} |f(x)|^p dx \right)^{1/p} < \infty,$$

where the supremum is taken over all balls $B(x_0, r)$ in $\mathbb{R}^n$ with $x_0 \in \mathbb{R}^n$. We also denote by $WL^{1,\Theta}(\mathbb{R}^n)$ the generalized weak Morrey space of all measurable functions f for which

$$\sup_{B(x_0, r)} \sup_{\lambda > 0} \frac{1}{\Theta(r)} \lambda \cdot |\{x \in B(x_0, r) : |f(x)| > \lambda\}| \leq C < \infty.$$

In order to unify these two definitions, we will introduce Morrey type spaces as follows. Let $0 \leq \kappa < 1$. Assume that $\theta(\cdot)$ is a positive increasing function defined in $(0, +\infty)$ and satisfies the following $\mathcal{D}_\kappa$ condition:

$$\frac{\theta(\xi)}{\xi^\kappa} \leq C \cdot \frac{\theta(\xi')}{(\xi')^\kappa}, \quad \text{for any } 0 < \xi' < \xi < +\infty, \quad (2.9)$$

where $C > 0$ is a constant independent of ξ and ξ' .

Definition 2.3. Let $1 \leq p < \infty$, $0 \leq \kappa < 1$, θ satisfy the $\mathcal{D}_\kappa$ condition (2.9) and w be a weight function on $\mathbb{R}^n$. We denote by $\mathcal{M}^{p,\theta}(w)$ the generalized weighted Morrey space of all locally integrable functions f defined on $\mathbb{R}^n$, such that for every ball B in $\mathbb{R}^n$,

$$\left(\frac{1}{\theta(w(B))} \int_B |f(x)|^p w(x) dx \right)^{1/p} \leq C < \infty.$$

Then we let $\|f\|_{\mathcal{M}^{p,\theta}(w)}$ be the smallest constant $C > 0$ satisfying the above estimate and $\mathcal{M}^{p,\theta}(w)$ becomes a Banach function space with norm $\|\cdot\|_{\mathcal{M}^{p,\theta}(w)}$. In the unweighted case (when w equals a constant function), we denote the generalized unweighted Morrey space by $\mathcal{M}^{p,\theta}(\mathbb{R}^n)$. That is, let $1 \leq p < \infty$ and θ satisfy the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, we define

$$\mathcal{M}^{p,\theta}(\mathbb{R}^n) := \left\{ f \in L_{loc}^p(\mathbb{R}^n) : \|f\|_{\mathcal{M}^{p,\theta}} = \sup_B \left(\frac{1}{\theta(|B|)} \int_B |f(x)|^p dx \right)^{1/p} < \infty \right\}.$$

Definition 2.4. Let $p = 1$, $0 \leq \kappa < 1$, θ satisfy the $\mathcal{D}_\kappa$ condition (2.9) and w be a weight function on $\mathbb{R}^n$. We denote by $W\mathcal{M}^{1,\theta}(w)$ the generalized weighted weak Morrey space consisting of all measurable functions f defined on $\mathbb{R}^n$ for which

$$\|f\|_{W\mathcal{M}^{1,\theta}(w)} := \sup_B \sup_{\sigma > 0} \frac{1}{\theta(w(B))} \sigma \cdot w(\{x \in B : |f(x)| > \sigma\}) \leq C < \infty.$$

In the unweighted case (when w equals a constant function), we denote the generalized unweighted weak Morrey space by $W\mathcal{M}^{1,\theta}(\mathbb{R}^n)$. That is, let $p = 1$ and θ satisfy the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, we define

$$W\mathcal{M}^{1,\theta}(\mathbb{R}^n) := \left\{ f : \|f\|_{W\mathcal{M}^{1,\theta}} = \sup_B \sup_{\sigma > 0} \frac{1}{\theta(|B|)} \sigma \cdot |\{x \in B : |f(x)| > \sigma\}| < \infty \right\}.$$

Note that

- If $\theta(x) \equiv 1$, then $\mathcal{M}^{p,\theta}(w) = L_w^p(\mathbb{R}^n)$ and $W\mathcal{M}^{p,\theta}(w) = WL_w^p(\mathbb{R}^n)$. Thus our (weak) Morrey type space is an extension of the weighted (weak) Lebesgue space;
- If $\theta(x) = x^\kappa$ with $0 < \kappa < 1$, then $\mathcal{M}^{p,\theta}(w)$ is just the weighted Morrey space $L^{p,\kappa}(w)$, and $W\mathcal{M}^{1,\theta}(w)$ is just the weighted weak Morrey space $WL^{1,\kappa}(w)$;
- If w equals a constant function, below we will show that $\mathcal{M}^{p,\theta}(\mathbb{R}^n)$ reduces to the generalized Morrey space $L^{p,\Theta}(\mathbb{R}^n)$, and $W\mathcal{M}^{1,\theta}(\mathbb{R}^n)$ reduces to the generalized weak Morrey space $WL^{1,\Theta}(\mathbb{R}^n)$.

2.3 Main theorems

The main results of this paper can be stated as follows.

Theorem 2.1. *Let $0 < \alpha \leq 1$, $1 < p < \infty$ and $w \in A_p$. Assume that θ satisfies the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)}.$$

Theorem 2.2. *Let $0 < \alpha \leq 1$, $p = 1$ and $w \in A_1$. Assume that θ satisfies the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{W\mathcal{M}^{1,\theta}(w)} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{1,\theta}(w)}.$$

Theorem 2.3. *Let $0 < \alpha \leq 1$, $1 < p < \infty$, $w \in A_p$ and $b \in BMO(\mathbb{R}^n)$. Assume that θ satisfies the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)}.$$

In order to simplify the notations, for any given $\sigma > 0$, we set

$$\Phi\left(\frac{|f(x)|}{\sigma}\right) = \frac{|f(x)|}{\sigma} \cdot \left(1 + \log^+ \frac{|f(x)|}{\sigma}\right)$$

when $\Phi(t) = t \cdot (1 + \log^+ t)$ and $\log^+ t = \max\{\log t, 0\}$. For the endpoint estimates for these commutator operators in the weighted Lebesgue space $L_w^1(\mathbb{R}^n)$, we will show

Theorem 2.4. *Let $0 < \alpha \leq 1$, $p = 1$, $w \in A_1$ and $b \in BMO(\mathbb{R}^n)$. Then for any given $\sigma > 0$, there exists a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ and $\sigma > 0$ such that*

$$w\left(\left\{x \in \mathbb{R}^n : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2\right)^{1/2} > \sigma\right\}\right) \leq C \int_{\mathbb{R}^n} \Phi\left(\frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma}\right) \cdot w(x) dx,$$

where $\Phi(t) = t \cdot (1 + \log^+ t)$ and $\|\vec{f}(x)\|_{\ell^2} = \left(\sum_j |f_j(x)|^2\right)^{1/2}$.

For the endpoint estimates of commutators generated by $BMO(\mathbb{R}^n)$ functions and vector-valued intrinsic square functions in the Morrey type spaces associated to θ , we will prove

Theorem 2.5. *Let $0 < \alpha \leq 1$, $p = 1$, $w \in A_1$ and $b \in BMO(\mathbb{R}^n)$. Assume that θ satisfies the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, then for any given $\sigma > 0$ and any ball B in $\mathbb{R}^n$, there exists a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$, B and $\sigma > 0$ such that*

$$\begin{aligned} & \frac{1}{\theta(w(B))} \cdot w \left(\left\{ x \in B : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{1/2} > \sigma \right\} \right) \\ & \leq C \cdot \sup_B \left\{ \frac{\Phi\left(\frac{w(B)}{\theta(w(B))}\right)}{w(B)} \int_B \Phi\left(\frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma}\right) \cdot w(x) dx \right\}, \end{aligned}$$

where $\Phi(t) = t \cdot (1 + \log^+ t)$ and $\|\vec{f}(x)\|_{\ell^2} = \left(\sum_j |f_j(x)|^2 \right)^{1/2}$.

In particular, if we take $\theta(x) = x^\kappa$ with $0 < \kappa < 1$, then we immediately get the following strong type estimates and endpoint estimates of vector-valued intrinsic square functions and commutators in the weighted Morrey spaces $L^{p,\kappa}(w)$ for all $0 < \kappa < 1$ and $1 \leq p < \infty$.

Corollary 2.6. *Let $0 < \alpha \leq 1$, $1 < p < \infty$, $0 < \kappa < 1$ and $w \in A_p$. Then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{L^{p,\kappa}(w)} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L^{p,\kappa}(w)}.$$

Corollary 2.7. *Let $0 < \alpha \leq 1$, $p = 1$, $0 < \kappa < 1$ and $w \in A_1$. Then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{WL^{1,\kappa}(w)} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L^{1,\kappa}(w)}.$$

Corollary 2.8. *Let $0 < \alpha \leq 1$, $1 < p < \infty$, $0 < \kappa < 1$, $w \in A_p$ and $b \in BMO(\mathbb{R}^n)$. Then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)|^2 \right)^{1/2} \right\|_{L^{p,\kappa}(w)} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L^{p,\kappa}(w)}.$$

Corollary 2.9. *Let $0 < \alpha \leq 1$, $p = 1$, $0 < \kappa < 1$, $w \in A_1$ and $b \in BMO(\mathbb{R}^n)$. Then for any given $\sigma > 0$ and any ball B in $\mathbb{R}^n$, there exists a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$, B and $\sigma > 0$ such that*

$$\begin{aligned} & \frac{1}{w(B)^\kappa} \cdot w \left(\left\{ x \in B : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{1/2} > \sigma \right\} \right) \\ & \leq C \cdot \sup_B \left\{ \frac{\Phi(w(B)^{1-\kappa})}{w(B)} \int_B \Phi\left(\frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma}\right) \cdot w(x) dx \right\}, \end{aligned}$$

where $\Phi(t) = t \cdot (1 + \log^+ t)$ and $\|\vec{f}(x)\|_{\ell^2} = \left(\sum_j |f_j(x)|^2\right)^{1/2}$.

We can also take w to be a constant function, then we immediately get the following unweighted results.

Corollary 2.10. *Let $0 < \alpha \leq 1$ and $1 < p < \infty$. Assume that θ satisfies the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}}.$$

Corollary 2.11. *Let $0 < \alpha \leq 1$ and $p = 1$. Assume that θ satisfies the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{W\mathcal{M}^{1,\theta}} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{1,\theta}}.$$

Corollary 2.12. *Let $0 < \alpha \leq 1$, $1 < p < \infty$ and $b \in BMO(\mathbb{R}^n)$. Assume that θ satisfies the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}}.$$

Corollary 2.13. *Let $0 < \alpha \leq 1$, $p = 1$ and $b \in BMO(\mathbb{R}^n)$. Assume that θ satisfies the $\mathcal{D}_\kappa$ condition (2.9) with $0 \leq \kappa < 1$, then for any given $\sigma > 0$ and any ball B in $\mathbb{R}^n$, there exists a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$, B and $\sigma > 0$ such that*

$$\begin{aligned} & \frac{1}{\theta(|B|)} \cdot \left| \left\{ x \in B : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{1/2} > \sigma \right\} \right| \\ & \leq C \cdot \sup_B \left\{ \frac{\Phi\left(\frac{|B|}{\theta(|B|)}\right)}{|B|} \int_B \Phi\left(\frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma}\right) dx \right\}, \end{aligned}$$

where $\Phi(t) = t \cdot (1 + \log^+ t)$ and $\|\vec{f}(x)\|_{\ell^2} = \left(\sum_j |f_j(x)|^2\right)^{1/2}$.

Let $\Theta = \Theta(r)$, $r > 0$, be a growth function with doubling constant $D(\Theta) : 1 \leq D(\Theta) < 2^n$. If for any fixed $x_0 \in \mathbb{R}^n$, we set $\theta(|B(x_0, r)|) = \Theta(r)$, then

$$\theta(2^n |B(x_0, r)|) = \theta(|B(x_0, 2r)|) = \Theta(2r).$$

For the doubling constant $D(\Theta)$ satisfying $1 \leq D(\Theta) < 2^n$, which means that $D(\Theta) = 2^{\kappa \cdot n}$ for some $0 \leq \kappa < 1$, then we are able to verify that θ is an increasing

function and satisfies the $\mathcal{D}_\kappa$ condition (2.9) with some $0 \leq \kappa < 1$. Thus, by the above unweighted results (Corollaries 2.10 through 2.13), we can also obtain strong type estimates and endpoint estimates of vector-valued intrinsic square functions and commutators in the generalized Morrey spaces $L^{p,\Theta}(\mathbb{R}^n)$ when $1 \leq p < \infty$ and Θ satisfies the doubling condition (2.8).

Corollary 2.14. *Let $0 < \alpha \leq 1$ and $1 < p < \infty$. Suppose that Θ satisfies the doubling condition (2.8) and $1 \leq D(\Theta) < 2^n$, then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{L^{p,\Theta}} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L^{p,\Theta}}.$$

Corollary 2.15. *Let $0 < \alpha \leq 1$ and $p = 1$. Suppose that Θ satisfies the doubling condition (2.8) and $1 \leq D(\Theta) < 2^n$, then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |\mathcal{S}_\alpha(f_j)|^2 \right)^{1/2} \right\|_{WL^{1,\Theta}} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L^{1,\Theta}}.$$

Corollary 2.16. *Let $0 < \alpha \leq 1$, $1 < p < \infty$ and $b \in BMO(\mathbb{R}^n)$. Suppose that Θ satisfies the doubling condition (2.8) and $1 \leq D(\Theta) < 2^n$, then there is a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)|^2 \right)^{1/2} \right\|_{L^{p,\Theta}} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L^{p,\Theta}}.$$

Corollary 2.17. *Let $0 < \alpha \leq 1$, $p = 1$ and $b \in BMO(\mathbb{R}^n)$. Suppose that Θ satisfies the doubling condition (2.8) and $1 \leq D(\Theta) < 2^n$, then for any given $\sigma > 0$ and any ball $B(x_0, r)$ in $\mathbb{R}^n$, there exists a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$, $B(x_0, r)$ and $\sigma > 0$ such that*

$$\begin{aligned} & \frac{1}{\Theta(r)} \cdot \left| \left\{ x \in B(x_0, r) : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{1/2} > \sigma \right\} \right| \\ & \leq C \cdot \sup_{r>0} \left\{ \frac{\Phi\left(\frac{|B(x_0, r)|}{\Theta(r)}\right)}{|B(x_0, r)|} \int_{B(x_0, r)} \Phi\left(\frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma}\right) dx \right\}, \end{aligned}$$

where $\Phi(t) = t \cdot (1 + \log^+ t)$ and $\|\vec{f}(x)\|_{\ell^2} = \left(\sum_j |f_j(x)|^2 \right)^{1/2}$.

Throughout this paper, the letter C always denotes a positive constant independent of the main parameters involved, but it may be different from line to line.

3 Proofs of Theorems 2.1 and 2.2

Proof of Theorem 2.1. Let $(\sum_j |f_j|^2)^{1/2} \in \mathcal{M}^{p,\theta}(w)$ with $1 < p < \infty$ and $w \in A_p$. For arbitrary $x_0 \in \mathbb{R}^n$, set $B = B(x_0, r_B)$ for the ball centered at x_0 and of radius r_B . We represent f_j as

$$f_j = f_j \cdot \chi_{2B} + f_j \cdot \chi_{(2B)^c} := f_j^0 + f_j^\infty,$$

where χ_{2B} denotes the characteristic function of $2B = B(x_0, 2r_B) \subseteq \mathbb{R}^n$, $j = 1, 2, \dots$. Then we write

$$\begin{aligned} & \frac{1}{\theta(w(B))^{1/p}} \left(\int_B \left(\sum_j |\mathcal{S}_\alpha(f_j)(x)|^2 \right)^{p/2} w(x) dx \right)^{1/p} \\ & \leq \frac{1}{\theta(w(B))^{1/p}} \left(\int_B \left(\sum_j |\mathcal{S}_\alpha(f_j^0)(x)|^2 \right)^{p/2} w(x) dx \right)^{1/p} \\ & \quad + \frac{1}{\theta(w(B))^{1/p}} \left(\int_B \left(\sum_j |\mathcal{S}_\alpha(f_j^\infty)(x)|^2 \right)^{p/2} w(x) dx \right)^{1/p} \\ & := I_1 + I_2. \end{aligned}$$

Let us first estimate I_1 . From the boundedness of vector-valued intrinsic square functions in $L_w^p(\mathbb{R}^n)$ (see Theorem A), it follows that

$$\begin{aligned} I_1 & \leq \frac{1}{\theta(w(B))^{1/p}} \left\| \left(\sum_j |\mathcal{S}_\alpha(f_j^0)|^2 \right)^{1/2} \right\|_{L_w^p} \\ & \leq C \cdot \frac{1}{\theta(w(B))^{1/p}} \left(\int_{2B} \left(\sum_j |f_j(x)|^2 \right)^{p/2} w(x) dx \right)^{1/p} \\ & \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)} \cdot \frac{\theta(w(2B))^{1/p}}{\theta(w(B))^{1/p}}. \end{aligned}$$

Moreover, since $0 < w(B) < w(2B) < +\infty$ when $w \in A_p$ with $1 < p < \infty$, then by the $\mathcal{D}_\kappa$ condition (2.9) of θ and the inequality (2.1), we obtain

$$\begin{aligned} I_1 & \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)} \cdot \frac{w(2B)^{\kappa/p}}{w(B)^{\kappa/p}} \\ & \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)}. \end{aligned}$$

We now consider the other term I_2 . For any $\varphi \in \mathcal{C}_\alpha$, $0 < \alpha \leq 1$, $j = 1, 2, \dots$, and $(y, t) \in \Gamma(x)$ with $x \in B$, we have

$$\begin{aligned} \left| \int_{\mathbb{R}^n} \varphi_t(y-z) f_j^\infty(z) dz \right| &= \left| \int_{(2B)^c} \varphi_t(y-z) f_j(z) dz \right| \\ &\leq C \cdot t^{-n} \int_{(2B)^c \cap \{z: |y-z| \leq t\}} |f_j(z)| dz \\ &\leq C \cdot t^{-n} \sum_{l=1}^{\infty} \int_{(2^{l+1}B \setminus 2^l B) \cap \{z: |y-z| \leq t\}} |f_j(z)| dz. \end{aligned} \quad (3.1)$$

Since $|y-z| \leq t$ and $(y, t) \in \Gamma(x)$, then one has $|x-z| \leq |x-y| + |y-z| \leq 2t$. Hence, for any $x \in B$ and $z \in (2^{l+1}B \setminus 2^l B)$, a direct computation shows that

$$2t \geq |x-z| \geq |z-x_0| - |x-x_0| \geq 2^{l-1}r_B. \quad (3.2)$$

Therefore, by using the above inequalities (3.1) and (3.2) together with Minkowski's inequality for integrals, we can deduce

$$\begin{aligned} \mathcal{S}_\alpha(f_j^\infty)(x) &= \left(\iint_{\Gamma(x)} \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} \varphi_t(y-z) f_j^\infty(z) dz \right|^2 \frac{dydt}{t^{n+1}} \right)^{1/2} \\ &\leq C \left(\int_{2^{l-2}r_B}^{\infty} \int_{|x-y| < t} \left| t^{-n} \sum_{l=1}^{\infty} \int_{2^{l+1}B \setminus 2^l B} |f_j(z)| dz \right|^2 \frac{dydt}{t^{n+1}} \right)^{1/2} \\ &\leq C \left(\sum_{l=1}^{\infty} \int_{2^{l+1}B \setminus 2^l B} |f_j(z)| dz \right) \left(\int_{2^{l-2}r_B}^{\infty} \frac{dt}{t^{2n+1}} \right)^{1/2} \\ &\leq C \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B \setminus 2^l B} |f_j(z)| dz. \end{aligned}$$

Then by duality and Cauchy-Schwarz inequality, we get

$$\begin{aligned} &\left(\sum_j |\mathcal{S}_\alpha(f_j^\infty)(x)|^2 \right)^{1/2} \\ &\leq C \left(\sum_j \left| \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B \setminus 2^l B} |f_j(z)| dz \right|^2 \right)^{1/2} \\ &\leq C \sup_{(\sum_j |\zeta_j|^2)^{1/2} \leq 1} \sum_j \left(\sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} |f_j(z)| dz \cdot \zeta_j \right) \\ &\leq C \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} \sup_{(\sum_j |\zeta_j|^2)^{1/2} \leq 1} \left(\sum_j |f_j(z)| \cdot \zeta_j \right) dz \\ &\leq C \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz. \end{aligned} \quad (3.3)$$

Furthermore, it follows from Hölder's inequality and A_p condition on w that

$$\begin{aligned}
& \left(\sum_j |\mathcal{S}_\alpha(f_j^\infty)(x)|^2 \right)^{1/2} \\
& \leq C \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \left(\int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{p/2} w(z) dz \right)^{1/p} \times \left(\int_{2^{l+1}B} w(z)^{-p'/p} dz \right)^{1/p'} \\
& \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)} \times \sum_{l=1}^{\infty} \frac{\theta(w(2^{l+1}B))^{1/p}}{w(2^{l+1}B)^{1/p}}.
\end{aligned}$$

Hence, by the above pointwise estimate,

$$I_2 \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)} \times \sum_{l=1}^{\infty} \frac{\theta(w(2^{l+1}B))^{1/p}}{\theta(w(B))^{1/p}} \cdot \frac{w(B)^{1/p}}{w(2^{l+1}B)^{1/p}}.$$

For any $l \in \mathbb{Z}^+$, since $0 < w(B) < w(2^{l+1}B) < +\infty$ when $w \in A_p \subset A_\infty$ with $1 < p < \infty$, then by using the $\mathcal{D}_\kappa$ condition (2.9) of θ again, the inequality (2.3) with exponent $\delta > 0$ and the fact that $0 \leq \kappa < 1$, we find that

$$\begin{aligned}
\sum_{l=1}^{\infty} \frac{\theta(w(2^{l+1}B))^{1/p}}{\theta(w(B))^{1/p}} \cdot \frac{w(B)^{1/p}}{w(2^{l+1}B)^{1/p}} & \leq C \sum_{l=1}^{\infty} \frac{w(B)^{(1-\kappa)/p}}{w(2^{l+1}B)^{(1-\kappa)/p}} \\
& \leq C \sum_{l=1}^{\infty} \left(\frac{|B|}{|2^{l+1}B|} \right)^{\delta(1-\kappa)/p} \\
& \leq C \sum_{l=1}^{\infty} \left(\frac{1}{2^{(l+1)n}} \right)^{\delta(1-\kappa)/p} \\
& \leq C,
\end{aligned} \tag{3.4}$$

where the last series is convergent since the exponent $\delta(1-\kappa)/p$ is positive. This implies our desired estimate

$$I_2 \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)}.$$

Combining the above two estimates for I_1 and I_2 , and then taking the supremum over all balls $B \subset \mathbb{R}^n$, we complete the proof of Theorem 2.1. $\square$

Proof of Theorem 2.2. Let $(\sum_j |f_j|^2)^{1/2} \in \mathcal{M}^{1,\theta}(w)$ with $w \in A_1$. For arbitrary $x_0 \in \mathbb{R}^n$, set $B = B(x_0, r_B)$ for the ball centered at x_0 and of radius r_B . Write $f_j = f_j^0 + f_j^\infty$ with $f_j^0 = f_j \cdot \chi_{2B}$ and $f_j^\infty = f_j \cdot \chi_{(2B)^c}$, $j = 1, 2, \dots$. Then for any given $\sigma > 0$, we have

$$\frac{1}{\theta(w(B))} \sigma \cdot w \left(\left\{ x \in B : \left(\sum_j |\mathcal{S}_\alpha(f_j)(x)|^2 \right)^{1/2} > \sigma \right\} \right)$$

$$\begin{aligned}
&\leq \frac{1}{\theta(w(B))} \sigma \cdot w \left(\left\{ x \in B : \left(\sum_j |\mathcal{S}_\alpha(f_j^0)(x)|^2 \right)^{1/2} > \sigma/2 \right\} \right) \\
&+ \frac{1}{\theta(w(B))} \sigma \cdot w \left(\left\{ x \in B : \left(\sum_j |\mathcal{S}_\alpha(f_j^\infty)(x)|^2 \right)^{1/2} > \sigma/2 \right\} \right) \\
&:= I'_1 + I'_2.
\end{aligned}$$

Below we will give the estimates of I'_1 and I'_2 , respectively. From the weighted weak $(1, 1)$ boundedness of vector-valued intrinsic square functions (see Theorem B), it follows that

$$\begin{aligned}
I'_1 &\leq \frac{2}{\theta(w(B))} \left\| \left(\sum_j |\mathcal{S}_\alpha(f_j^0)|^2 \right)^{1/2} \right\|_{WL_w^1} \\
&\leq C \cdot \frac{1}{\theta(w(B))} \left(\int_{2B} \left(\sum_j |f_j(x)|^2 \right)^{1/2} w(x) dx \right) \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{1,\theta}(w)} \cdot \frac{\theta(w(2B))}{\theta(w(B))}.
\end{aligned}$$

Moreover, since $0 < w(B) < w(2B) < +\infty$ when $w \in A_1$, then by the $\mathcal{D}_\kappa$ condition (2.9) of θ and inequality (2.1), we get

$$\begin{aligned}
I'_1 &\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{1,\theta}(w)} \cdot \frac{w(2B)^\kappa}{w(B)^\kappa} \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{1,\theta}(w)}.
\end{aligned}$$

As for the term I'_2 , it follows directly from Chebyshev's inequality and the pointwise estimate (3.3) that

$$\begin{aligned}
I'_2 &\leq \frac{1}{\theta(w(B))} \sigma \cdot \frac{2}{\sigma} \int_B \left(\sum_j |\mathcal{S}_\alpha(f_j^\infty)(x)|^2 \right)^{1/2} w(x) dx \\
&\leq C \cdot \frac{w(B)}{\theta(w(B))} \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz. \quad (3.5)
\end{aligned}$$

Another application of A_1 condition on w gives that

$$\begin{aligned}
&\frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \\
&\leq C \frac{1}{w(2^{l+1}B)} \cdot \operatorname{ess\,inf}_{z \in 2^{l+1}B} w(z) \int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \\
&\leq C \frac{1}{w(2^{l+1}B)} \left(\int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{1/2} w(z) dz \right)
\end{aligned}$$

$$\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{1,\theta}(w)} \cdot \frac{\theta(w(2^{l+1}B))}{w(2^{l+1}B)}. \quad (3.6)$$

Substituting the above inequality (3.6) into (3.5), we thus obtain

$$I'_2 \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{1,\theta}(w)} \times \sum_{l=1}^{\infty} \frac{\theta(w(2^{l+1}B))}{\theta(w(B))} \cdot \frac{w(B)}{w(2^{l+1}B)}.$$

Note that $w \in A_1 \subset A_{\infty}$, then one has $0 < w(B) < w(2^{l+1}B) < +\infty$ for any $l \in \mathbb{Z}^+$. Thus, by using the $\mathcal{D}_{\kappa}$ condition (2.9) of θ again, the inequality (2.3) with exponent $\delta^* > 0$ and the fact that $0 \leq \kappa < 1$, we find that

$$\begin{aligned} \sum_{l=1}^{\infty} \frac{\theta(w(2^{l+1}B))}{\theta(w(B))} \cdot \frac{w(B)}{w(2^{l+1}B)} &\leq C \sum_{l=1}^{\infty} \frac{w(B)^{1-\kappa}}{w(2^{l+1}B)^{1-\kappa}} \\ &\leq C \sum_{l=1}^{\infty} \left(\frac{|B|}{|2^{l+1}B|} \right)^{\delta^*(1-\kappa)} \\ &\leq C \sum_{l=1}^{\infty} \left(\frac{1}{2^{(l+1)n}} \right)^{\delta^*(1-\kappa)} \\ &\leq C. \end{aligned} \quad (3.7)$$

Therefore,

$$I'_2 \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{1,\theta}(w)}.$$

Summing up the above estimates for I'_1 and I'_2 , and then taking the supremum over all balls $B \subset \mathbb{R}^n$ and all $\sigma > 0$, we finish the proof of Theorem 2.2. $\square$

4 Proof of Theorem 2.3

Given a real-valued function $b \in BMO(\mathbb{R}^n)$, we will follow the idea developed in [1, 2] and denote $F(\xi) = e^{\xi[b(x)-b(z)]}$, $\xi \in \mathbb{C}$. Then by the analyticity of $F(\xi)$ on $\mathbb{C}$ and the Cauchy integral formula, we get

$$\begin{aligned} b(x) - b(z) &= F'(0) = \frac{1}{2\pi i} \int_{|\xi|=1} \frac{F(\xi)}{\xi^2} d\xi \\ &= \frac{1}{2\pi} \int_0^{2\pi} e^{e^{i\theta}[b(x)-b(z)]} \cdot e^{-i\theta} d\theta. \end{aligned}$$

Thus, for any $\varphi \in \mathcal{C}_{\alpha}$, $0 < \alpha \leq 1$ and $j \in \mathbb{Z}^+$, we obtain

$$\begin{aligned} &\left| \int_{\mathbb{R}^n} [b(x) - b(z)] \varphi_t(y - z) f_j(z) dz \right| \\ &= \left| \frac{1}{2\pi} \int_0^{2\pi} \left(\int_{\mathbb{R}^n} \varphi_t(y - z) e^{-e^{i\theta}b(z)} f_j(z) dz \right) e^{e^{i\theta}b(x)} \cdot e^{-i\theta} d\theta \right| \end{aligned}$$

$$\begin{aligned}
&\leq \frac{1}{2\pi} \int_0^{2\pi} \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} \varphi_t(y-z) e^{-e^{i\theta} b(z)} f_j(z) dz \right| e^{\cos \theta \cdot b(x)} d\theta \\
&\leq \frac{1}{2\pi} \int_0^{2\pi} A_\alpha(e^{-e^{i\theta} b} \cdot f_j)(y, t) \cdot e^{\cos \theta \cdot b(x)} d\theta.
\end{aligned}$$

So we have

$$|[b, \mathcal{S}_\alpha](f_j)(x)| \leq \frac{1}{2\pi} \int_0^{2\pi} \mathcal{S}_\alpha(e^{-e^{i\theta} b} \cdot f_j)(x) \cdot e^{\cos \theta \cdot b(x)} d\theta.$$

Moreover, by using standard duality argument and Cauchy–Schwarz inequality, we get

$$\begin{aligned}
&\left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{1/2} \\
&\leq \frac{1}{2\pi} \left(\sum_j \left| \int_0^{2\pi} \mathcal{S}_\alpha(e^{-e^{i\theta} b} \cdot f_j)(x) \cdot e^{\cos \theta \cdot b(x)} d\theta \right|^2 \right)^{1/2} \\
&\leq \frac{1}{2\pi} \sup_{(\sum_j |\zeta_j|^2)^{1/2} \leq 1} \sum_j \left(\int_0^{2\pi} \mathcal{S}_\alpha(e^{-e^{i\theta} b} \cdot f_j)(x) \cdot e^{\cos \theta \cdot b(x)} d\theta \cdot \zeta_j \right) \\
&\leq \frac{1}{2\pi} \int_0^{2\pi} \sup_{(\sum_j |\zeta_j|^2)^{1/2} \leq 1} \left(\sum_j \mathcal{S}_\alpha(e^{-e^{i\theta} b} \cdot f_j)(x) \cdot e^{\cos \theta \cdot b(x)} \cdot \zeta_j \right) d\theta \\
&\leq \frac{1}{2\pi} \int_0^{2\pi} \left(\sum_j \left| \mathcal{S}_\alpha(e^{-e^{i\theta} b} \cdot f_j)(x) \right|^2 \right)^{1/2} \cdot e^{\cos \theta \cdot b(x)} d\theta.
\end{aligned}$$

Therefore, by the L_w^p -boundedness of vector-valued intrinsic square functions (see Theorem A), and using the same arguments as in [2], we can also show the following result.

Theorem 4.1. *Let $0 < \alpha \leq 1$, $1 < p < \infty$ and $w \in A_p$. Then there exists a constant $C > 0$ independent of $\vec{f} = (f_1, f_2, \dots)$ such that*

$$\left\| \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)|^2 \right)^{1/2} \right\|_{L_w^p} \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L_w^p}$$

provided that $b \in BMO(\mathbb{R}^n)$.

We are now in a position to give the proof of Theorem 2.3.

Proof. Let $(\sum_j |f_j|^2)^{1/2} \in \mathcal{M}^{p,\theta}(w)$ with $1 < p < \infty$ and $w \in A_p$. Fix $x_0 \in \mathbb{R}^n$ and let $B = B(x_0, r_B)$ be a ball centered at x_0 of radius r_B . We split f_j by $f_j = f_j^0 + f_j^\infty$, where $f_j^0 = f_j \cdot \chi_{2B}$ and $2B = B(x_0, 2r_B) \subseteq \mathbb{R}^n$, $j = 1, 2, \dots$. Then we write

$$\frac{1}{\theta(w(B))^{1/p}} \left(\int_B \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{p/2} w(x) dx \right)^{1/p}$$

$$\begin{aligned}
&\leq \frac{1}{\theta(w(B))^{1/p}} \left(\int_B \left(\sum_j |[b, \mathcal{S}_\alpha](f_j^0)(x)|^2 \right)^{p/2} w(x) dx \right)^{1/p} \\
&\quad + \frac{1}{\theta(w(B))^{1/p}} \left(\int_B \left(\sum_j |[b, \mathcal{S}_\alpha](f_j^\infty)(x)|^2 \right)^{p/2} w(x) dx \right)^{1/p} \\
&:= J_1 + J_2.
\end{aligned}$$

By using Theorem 4.1, the $\mathcal{D}_\kappa$ condition (2.9) of θ and the inequality (2.1), we obtain

$$\begin{aligned}
J_1 &\leq \frac{1}{\theta(w(B))^{1/p}} \left\| \left(\sum_j |[b, \mathcal{S}_\alpha](f_j^0)|^2 \right)^{1/2} \right\|_{L_w^p} \\
&\leq C \cdot \frac{1}{\theta(w(B))^{1/p}} \left(\int_{2B} \left(\sum_j |f_j(x)|^2 \right)^{p/2} w(x) dx \right)^{1/p} \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p, \theta}(w)} \cdot \frac{\theta(w(2B))^{1/p}}{\theta(w(B))^{1/p}} \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p, \theta}(w)} \cdot \frac{w(2B)^{\kappa/p}}{w(B)^{\kappa/p}} \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p, \theta}(w)}.
\end{aligned}$$

Let us now turn to estimate the other term J_2 . For any given $x \in B$, $(y, t) \in \Gamma(x)$ and for $j = 1, 2, \dots$, we have

$$\begin{aligned}
\sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} [b(x) - b(z)] \varphi_t(y - z) f_j^\infty(z) dz \right| &\leq |b(x) - b_B| \cdot \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} \varphi_t(y - z) f_j^\infty(z) dz \right| \\
&\quad + \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} [b_B - b(z)] \varphi_t(y - z) f_j^\infty(z) dz \right|.
\end{aligned}$$

By definition, we thus have

$$|[b, \mathcal{S}_\alpha](f_j^\infty)(x)| \leq |b(x) - b_B| \cdot \mathcal{S}_\alpha(f_j^\infty)(x) + \mathcal{S}_\alpha([b_B - b]f_j^\infty)(x).$$

From this and Minkowski' inequality for series, we further obtain

$$\begin{aligned}
\left(\sum_j |[b, \mathcal{S}_\alpha](f_j^\infty)(x)|^2 \right)^{1/2} &\leq |b(x) - b_B| \left(\sum_j |\mathcal{S}_\alpha(f_j^\infty)(x)|^2 \right)^{1/2} \\
&\quad + \left(\sum_j |\mathcal{S}_\alpha([b_B - b]f_j^\infty)(x)|^2 \right)^{1/2}.
\end{aligned}$$

For any $\varphi \in \mathcal{C}_\alpha$, $0 < \alpha \leq 1$, $j = 1, 2, \dots$, and $(y, t) \in \Gamma(x)$ with $x \in B$, we have

$$\begin{aligned}
& \left| \int_{\mathbb{R}^n} [b_B - b(z)] \varphi_t(y - z) f_j^\infty(z) dz \right| \\
&= \left| \int_{(2B)^c} [b_B - b(z)] \varphi_t(y - z) f_j(z) dz \right| \\
&\leq C \cdot t^{-n} \int_{(2B)^c \cap \{z: |y-z| \leq t\}} |b(z) - b_B| |f_j(z)| dz \\
&\leq C \cdot t^{-n} \sum_{l=1}^{\infty} \int_{(2^{l+1}B \setminus 2^l B) \cap \{z: |y-z| \leq t\}} |b(z) - b_B| |f_j(z)| dz. \quad (4.1)
\end{aligned}$$

Hence, for any $x \in B$, by using the inequalities (4.1) and (3.2) together with Minkowski's inequality for integrals, we can deduce that

$$\begin{aligned}
& \mathcal{S}_\alpha([b_B - b]f_j^\infty)(x) \\
&= \left(\iint_{\Gamma(x)} \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} [b_B - b(z)] \varphi_t(y - z) f_j^\infty(z) dz \right|^2 \frac{dy dt}{t^{n+1}} \right)^{1/2} \\
&\leq C \left(\int_{2^{l-2}r_B}^{\infty} \int_{|x-y|<t} \left| t^{-n} \sum_{l=1}^{\infty} \int_{2^{l+1}B \setminus 2^l B} |b(z) - b_B| |f_j(z)| dz \right|^2 \frac{dy dt}{t^{n+1}} \right)^{1/2} \\
&\leq C \left(\sum_{l=1}^{\infty} \int_{2^{l+1}B \setminus 2^l B} |b(z) - b_B| |f_j(z)| dz \right) \left(\int_{2^{l-2}r_B}^{\infty} \frac{dt}{t^{2n+1}} \right)^{1/2} \\
&\leq C \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B \setminus 2^l B} |b(z) - b_B| |f_j(z)| dz.
\end{aligned}$$

Therefore, by duality and Cauchy-Schwarz inequality, we get

$$\begin{aligned}
& \left(\sum_j \left| \mathcal{S}_\alpha([b_B - b]f_j^\infty)(x) \right|^2 \right)^{1/2} \\
&\leq C \left(\sum_j \left| \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B \setminus 2^l B} |b(z) - b_B| |f_j(z)| dz \right|^2 \right)^{1/2} \\
&\leq C \sup_{(\sum_j |\zeta_j|^2)^{1/2} \leq 1} \sum_j \left(\sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} |b(z) - b_B| |f_j(z)| dz \cdot \zeta_j \right) \\
&\leq C \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} \sup_{(\sum_j |\zeta_j|^2)^{1/2} \leq 1} \left(\sum_j |b(z) - b_B| |f_j(z)| \cdot \zeta_j \right) dz \\
&\leq C \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} |b(z) - b_B| \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz. \quad (4.2)
\end{aligned}$$

Consequently, from the pointwise estimates (3.3) and (4.2), it follows that

$$\begin{aligned}
J_2 &\leq \frac{C}{\theta(w(B))^{1/p}} \left(\int_B |b(x) - b_B|^p w(x) dx \right)^{1/p} \times \left(\sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \right) \\
&\quad + C \cdot \frac{w(B)^{1/p}}{\theta(w(B))^{1/p}} \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} |b_{2^{l+1}B} - b_B| \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \\
&\quad + C \cdot \frac{w(B)^{1/p}}{\theta(w(B))^{1/p}} \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} |b(z) - b_{2^{l+1}B}| \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \\
&:= J_3 + J_4 + J_5.
\end{aligned}$$

Recall that the following estimate holds for $w \in A_p$ and $1 \leq p < \infty$:

$$\left(\int_B |b(x) - b_B|^p w(x) dx \right)^{1/p} \leq C \|b\|_* \cdot w(B)^{1/p}. \quad (4.3)$$

Indeed, since $w \in A_p$ with $1 \leq p < \infty$, we know that there exists a number $r > 1$ such that $w \in RH_r$. By using Hölder's inequality and John–Nirenberg's inequality for BMO functions (see [3, 5]), we find that

$$\begin{aligned}
\left(\int_B |b(x) - b_B|^p w(x) dx \right)^{1/p} &\leq \left(\int_B |b(x) - b_B|^{pr'} dx \right)^{1/(pr')} \left(\int_B w(x)^r dx \right)^{1/(pr)} \\
&\leq C \cdot w(B)^{1/p} \left(\frac{1}{|B|} \int_B |b(x) - b_B|^{pr'} dx \right)^{1/(pr')} \\
&\leq C \|b\|_* \cdot w(B)^{1/p}.
\end{aligned}$$

Furthermore, it follows from (4.6), Hölder's inequality and the A_p condition on w that

$$\begin{aligned}
J_3 &\leq C \|b\|_* \cdot \frac{w(B)^{1/p}}{\theta(w(B))^{1/p}} \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \left(\int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{p/2} w(z) dz \right)^{1/p} \\
&\quad \times \left(\int_{2^{l+1}B} w(z)^{-p'/p} dz \right)^{1/p'} \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)} \times \sum_{l=1}^{\infty} \frac{\theta(w(2^{l+1}B))^{1/p}}{\theta(w(B))^{1/p}} \cdot \frac{w(B)^{1/p}}{w(2^{l+1}B)^{1/p}} \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)},
\end{aligned}$$

where in the last inequality we have used the estimate (3.4). For the term J_4 , since $b \in BMO(\mathbb{R}^n)$, a simple calculation shows that for every ball B (or cube Q)

$$|b_{2^{l+1}B} - b_B| \leq C \cdot (l+1) \|b\|_*. \quad (4.4)$$

We then use Hölder's inequality, (4.4) and the A_p condition on w to obtain

$$\begin{aligned}
J_4 &\leq C \|b\|_* \cdot \frac{w(B)^{1/p}}{\theta(w(B))^{1/p}} \sum_{l=1}^{\infty} \frac{l+1}{|2^{l+1}B|} \left(\int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{p/2} w(z) dz \right)^{1/p} \\
&\quad \times \left(\int_{2^{l+1}B} w(z)^{-p'/p} dz \right)^{1/p'} \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)} \times \sum_{l=1}^{\infty} (l+1) \cdot \frac{\theta(w(2^{l+1}B))^{1/p}}{\theta(w(B))^{1/p}} \cdot \frac{w(B)^{1/p}}{w(2^{l+1}B)^{1/p}}.
\end{aligned}$$

Applying the $\mathcal{D}_\kappa$ condition (2.9) of θ and the inequality (2.3) again together with the fact that $0 \leq \kappa < 1$, we thus have

$$\begin{aligned}
\sum_{l=1}^{\infty} (l+1) \cdot \frac{\theta(w(2^{l+1}B))^{1/p}}{\theta(w(B))^{1/p}} \cdot \frac{w(B)^{1/p}}{w(2^{l+1}B)^{1/p}} &\leq C \sum_{l=1}^{\infty} (l+1) \cdot \frac{w(B)^{(1-\kappa)/p}}{w(2^{l+1}B)^{(1-\kappa)/p}} \\
&\leq C \sum_{l=1}^{\infty} (l+1) \cdot \left(\frac{|B|}{|2^{l+1}B|} \right)^{\delta(1-\kappa)/p} \\
&\leq C \sum_{l=1}^{\infty} (l+1) \cdot \left(\frac{1}{2^{(l+1)n}} \right)^{\delta(1-\kappa)/p} \\
&\leq C,
\end{aligned} \tag{4.5}$$

which in turn gives that

$$J_4 \leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)}.$$

It remains to estimate the last term J_5 . An application of Hölder's inequality gives us that

$$\begin{aligned}
J_5 &\leq C \cdot \frac{w(B)^{1/p}}{\theta(w(B))^{1/p}} \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \left(\int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{p/2} w(z) dz \right)^{1/p} \\
&\quad \times \left(\int_{2^{l+1}B} |b(z) - b_{2^{l+1}B}|^{p'} w(z)^{-p'/p} dz \right)^{1/p'}.
\end{aligned}$$

If we set $\mu(z) = w(z)^{-p'/p}$, then we have $\mu \in A_{p'}$ because $w \in A_p$ (see [3, 4]). Then it follows from the inequality (4.6) and the A_p condition that

$$\begin{aligned}
\left(\int_{2^{l+1}B} |b(z) - b_{2^{l+1}B}|^{p'} \mu(z) dz \right)^{1/p'} &\leq C \|b\|_* \cdot \mu(2^{l+1}B)^{1/p'} \\
&= C \|b\|_* \cdot \left(\int_{2^{l+1}B} w(z)^{-p'/p} dz \right)^{1/p'} \\
&\leq C \|b\|_* \cdot \frac{|2^{l+1}B|}{w(2^{l+1}B)^{1/p}}.
\end{aligned} \tag{4.6}$$

Therefore, in view of the estimates (4.6) and (3.4), we conclude that

$$\begin{aligned}
J_5 &\leq C \|b\|_* \cdot \frac{w(B)^{1/p}}{\theta(w(B))^{1/p}} \sum_{l=1}^{\infty} \frac{1}{w(2^{l+1}B)^{1/p}} \left(\int_{2^{l+1}B} \left(\sum_j |f_j(z)|^2 \right)^{p/2} w(z) dz \right)^{1/p} \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)} \times \sum_{l=1}^{\infty} \frac{\theta(w(2^{l+1}B))^{1/p}}{\theta(w(B))^{1/p}} \cdot \frac{w(B)^{1/p}}{w(2^{l+1}B)^{1/p}} \\
&\leq C \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{\mathcal{M}^{p,\theta}(w)}.
\end{aligned}$$

Summarizing the above discussions, we finish the proof of the main theorem. $\square$

5 Proof of Theorem 2.4

Proof. Inspired by the works in [11, 13, 20], for any fixed $\sigma > 0$, we apply the Calderón–Zygmund decomposition of $\vec{f} = (f_1, f_2, \dots)$ at height σ to obtain a collection of disjoint non-overlapping dyadic cubes $\{Q_i\}$ such that the following property holds (see [13, 15])

$$\sigma < \frac{1}{|Q_i|} \int_{Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} dy \leq 2^n \cdot \sigma, \quad (5.1)$$

where $Q_i = Q(c_i, \ell_i)$ denotes the cube centered at c_i with side length ℓ_i and all cubes are assumed to have their sides parallel to the coordinate axes. If we set $E = \bigcup_i Q_i$, then

$$\left(\sum_j |f_j(y)|^2 \right)^{1/2} \leq \sigma, \quad \text{a.e. } x \in \mathbb{R}^n \setminus E.$$

Now we proceed to construct vector-valued version of the Calderón–Zygmund decomposition. Define two vector-valued functions $\vec{g} = (g_1, g_2, \dots)$ and $\vec{h} = (h_1, h_2, \dots)$ as follows:

$$g_j(x) = \begin{cases} f_j(x) & \text{if } x \in E^c, \\ \frac{1}{|Q_i|} \int_{Q_i} f_j(y) dy & \text{if } x \in Q_i, \end{cases}$$

and

$$h_j(x) = f_j(x) - g_j(x) = \sum_i h_{ij}(x), \quad j = 1, 2, \dots,$$

where $h_{ij}(x) = h_j(x) \cdot \chi_{Q_i}(x) = (f_j(x) - g_j(x)) \cdot \chi_{Q_i}(x)$. Then we have

$$\left(\sum_j |g_j(x)|^2 \right)^{1/2} \leq C \cdot \sigma, \quad \text{a.e. } x \in \mathbb{R}^n, \quad (5.2)$$

and

$$\vec{f} = \vec{g} + \vec{h} := (g_1 + h_1, g_2 + h_2, \dots). \quad (5.3)$$

Obviously, h_{ij} is supported on Q_i , $i, j = 1, 2, \dots$,

$$\int_{\mathbb{R}^n} h_{ij}(x) dx = 0, \quad \text{and} \quad \|h_{ij}\|_{L^1} = \int_{\mathbb{R}^n} |h_{ij}(x)| dx \leq 2 \int_{Q_i} |f_j(x)| dx$$

according to the above decomposition. By (5.3) and Minkowski's inequality,

$$\left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{1/2} \leq \left(\sum_j |[b, \mathcal{S}_\alpha](g_j)(x)|^2 \right)^{1/2} + \left(\sum_j |[b, \mathcal{S}_\alpha](h_j)(x)|^2 \right)^{1/2}.$$

Then we can write

$$\begin{aligned} & w \left(\left\{ x \in \mathbb{R}^n : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{1/2} > \sigma \right\} \right) \\ & \leq w \left(\left\{ x \in \mathbb{R}^n : \left(\sum_j |[b, \mathcal{S}_\alpha](g_j)(x)|^2 \right)^{1/2} > \sigma/2 \right\} \right) \\ & + w \left(\left\{ x \in \mathbb{R}^n : \left(\sum_j |[b, \mathcal{S}_\alpha](h_j)(x)|^2 \right)^{1/2} > \sigma/2 \right\} \right) \\ & := K_1 + K_2. \end{aligned}$$

Observe that $w \in A_1 \subset A_2$. Applying Chebyshev's inequality and Theorem 4.1, we obtain

$$K_1 \leq \frac{4}{\sigma^2} \cdot \left\| \left(\sum_j |[b, \mathcal{S}_\alpha](g_j)|^2 \right)^{1/2} \right\|_{L_w^2}^2 \leq \frac{C}{\sigma^2} \cdot \left\| \left(\sum_j |g_j|^2 \right)^{1/2} \right\|_{L_w^2}^2.$$

Moreover, by the inequality (5.2),

$$\begin{aligned} & \left\| \left(\sum_j |g_j|^2 \right)^{1/2} \right\|_{L_w^2}^2 \\ & \leq C \cdot \sigma \int_{\mathbb{R}^n} \left(\sum_j |g_j(x)|^2 \right)^{1/2} w(x) dx \\ & \leq C \cdot \sigma \left(\int_{E^c} \left(\sum_j |f_j(x)|^2 \right)^{1/2} w(x) dx + \int_{\bigcup_i Q_i} \left(\sum_j |g_j(x)|^2 \right)^{1/2} w(x) dx \right). \end{aligned}$$

Recall that $g_j(x) = \frac{1}{|Q_i|} \int_{Q_i} f_j(y) dy$ when $x \in Q_i$. As before, by using duality and Cauchy-Schwarz inequality, we can see the following estimate is valid for all $x \in Q_i$.

$$\left(\sum_j |g_j(x)|^2 \right)^{1/2} \leq \frac{1}{|Q_i|} \int_{Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} dy. \quad (5.4)$$

This estimate (5.4) along with the A_1 condition yields

$$\begin{aligned}
& \left\| \left(\sum_j |g_j|^2 \right)^{1/2} \right\|_{L_w^2}^2 \\
& \leq C \cdot \sigma \left(\int_{\mathbb{R}^n} \left(\sum_j |f_j(x)|^2 \right)^{1/2} w(x) dx + \sum_i \frac{w(Q_i)}{|Q_i|} \int_{Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} dy \right) \\
& \leq C \cdot \sigma \left(\int_{\mathbb{R}^n} \left(\sum_j |f_j(x)|^2 \right)^{1/2} w(x) dx + \sum_i \operatorname{ess\,inf}_{y \in Q_i} w(y) \int_{Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} dy \right) \\
& \leq C \cdot \sigma \left(\int_{\mathbb{R}^n} \left(\sum_j |f_j(x)|^2 \right)^{1/2} w(x) dx + \int_{\bigcup_i Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} w(y) dy \right) \\
& \leq C \cdot \sigma \int_{\mathbb{R}^n} \left(\sum_j |f_j(x)|^2 \right)^{1/2} w(x) dx. \tag{5.5}
\end{aligned}$$

So we have

$$K_1 \leq C \int_{\mathbb{R}^n} \frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma} \cdot w(x) dx \leq C \int_{\mathbb{R}^n} \Phi\left(\frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma}\right) \cdot w(x) dx.$$

To deal with the other term K_2 , let $Q_i^* = 2\sqrt{n}Q_i$ be the cube concentric with Q_i such that $\ell(Q_i^*) = (2\sqrt{n})\ell(Q_i)$. Then we can further decompose K_2 as follows.

$$\begin{aligned}
K_2 & \leq w\left(\left\{x \in \bigcup_i Q_i^* : \left(\sum_j |[b, \mathcal{S}_\alpha](h_j)(x)|^2\right)^{1/2} > \sigma/2\right\}\right) \\
& \quad + w\left(\left\{x \notin \bigcup_i Q_i^* : \left(\sum_j |[b, \mathcal{S}_\alpha](h_j)(x)|^2\right)^{1/2} > \sigma/2\right\}\right) \\
& := K_3 + K_4.
\end{aligned}$$

Since $w \in A_1$, then by the inequality (2.1), we can get

$$K_3 \leq \sum_i w(Q_i^*) \leq C \sum_i w(Q_i).$$

Furthermore, it follows from the inequality (5.1) and the A_1 condition that

$$\begin{aligned}
K_3 & \leq C \sum_i \frac{1}{\sigma} \cdot \operatorname{ess\,inf}_{y \in Q_i} w(y) \int_{Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} dy \\
& \leq \frac{C}{\sigma} \sum_i \int_{Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} w(y) dy \\
& \leq \frac{C}{\sigma} \int_{\bigcup_i Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} w(y) dy
\end{aligned}$$

$$\leq C \int_{\mathbb{R}^n} \frac{\|\vec{f}(y)\|_{\ell^2}}{\sigma} \cdot w(y) dy \leq C \int_{\mathbb{R}^n} \Phi\left(\frac{\|\vec{f}(y)\|_{\ell^2}}{\sigma}\right) \cdot w(y) dy.$$

Arguing as in the proof of Theorem 2.3, for any given $x \in \mathbb{R}^n$, $(y, t) \in \Gamma(x)$ and for $j = 1, 2, \dots$, we also find that

$$\begin{aligned} & \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} [b(x) - b(z)] \varphi_t(y - z) \sum_i h_{ij}(z) dz \right| \\ & \leq \sup_{\varphi \in \mathcal{C}_\alpha} \left| \sum_i [b(x) - b_{Q_i}] \int_{\mathbb{R}^n} \varphi_t(y - z) h_{ij}(z) dz \right| \\ & \quad + \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} \varphi_t(y - z) \sum_i [b_{Q_i} - b(z)] h_{ij}(z) dz \right| \\ & \leq \sum_i |b(x) - b_{Q_i}| \cdot \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} \varphi_t(y - z) h_{ij}(z) dz \right| \\ & \quad + \sup_{\varphi \in \mathcal{C}_\alpha} \left| \int_{\mathbb{R}^n} \varphi_t(y - z) \sum_i [b_{Q_i} - b(z)] h_{ij}(z) dz \right|. \end{aligned}$$

Hence, by definition, we have that for any given $x \in \mathbb{R}^n$ and $j \in \mathbb{Z}^+$,

$$|[b, \mathcal{S}_\alpha](h_j)(x)| \leq \sum_i |b(x) - b_{Q_i}| \cdot \mathcal{S}_\alpha(h_{ij})(x) + \mathcal{S}_\alpha\left(\sum_i [b_{Q_i} - b] h_{ij}\right)(x). \quad (5.6)$$

On the other hand, by duality argument and Cauchy–Schwarz inequality, we can see the following vector-valued form of Minkowski’s inequality is true for any real numbers $\nu_{ij} \in \mathbb{R}$, $i, j = 1, 2, \dots$

$$\left(\sum_j \left| \sum_i \nu_{ij} \right|^2 \right)^{1/2} \leq \sum_i \left(\sum_j |\nu_{ij}|^2 \right)^{1/2}. \quad (5.7)$$

Therefore, by the estimates (5.6) and (5.7), we get

$$\begin{aligned} \left(\sum_j |[b, \mathcal{S}_\alpha](h_j)(x)|^2 \right)^{1/2} & \leq \left(\sum_j \left| \sum_i |b(x) - b_{Q_i}| \cdot \mathcal{S}_\alpha(h_{ij})(x) \right|^2 \right)^{1/2} \\ & \quad + \left(\sum_j \left| \mathcal{S}_\alpha\left(\sum_i [b_{Q_i} - b] h_{ij}\right)(x) \right|^2 \right)^{1/2} \\ & \leq \sum_i |b(x) - b_{Q_i}| \cdot \left(\sum_j |\mathcal{S}_\alpha(h_{ij})(x)|^2 \right)^{1/2} \\ & \quad + \left(\sum_j \left| \mathcal{S}_\alpha\left(\sum_i [b_{Q_i} - b] h_{ij}\right)(x) \right|^2 \right)^{1/2}. \end{aligned}$$

Then the term K_4 can be divided into two parts.

$$\begin{aligned} K_4 &\leq w\left(\left\{x \notin \bigcup_i Q_i^* : \sum_i |b(x) - b_{Q_i}| \cdot \left(\sum_j |\mathcal{S}_\alpha(h_{ij})(x)|^2\right)^{1/2} > \sigma/4\right\}\right) \\ &\quad + w\left(\left\{x \notin \bigcup_i Q_i^* : \left(\sum_j \left|\mathcal{S}_\alpha\left(\sum_i [b_{Q_i} - b]h_{ij}\right)(x)\right|^2\right)^{1/2} > \sigma/4\right\}\right) \\ &:= K_5 + K_6. \end{aligned}$$

It follows directly from the Chebyshev's inequality that

$$\begin{aligned} K_5 &\leq \frac{4}{\sigma} \int_{\mathbb{R}^n \setminus \bigcup_i Q_i^*} \sum_i |b(x) - b_{Q_i}| \cdot \left(\sum_j |\mathcal{S}_\alpha(h_{ij})(x)|^2\right)^{1/2} w(x) dx \\ &\leq \frac{4}{\sigma} \sum_i \left(\int_{(Q_i^*)^c} |b(x) - b_{Q_i}| \cdot \left(\sum_j |\mathcal{S}_\alpha(h_{ij})(x)|^2\right)^{1/2} w(x) dx\right). \end{aligned}$$

Denote by c_i the center of Q_i . For any $\varphi \in \mathcal{C}_\alpha$, $0 < \alpha \leq 1$, by the cancellation condition of h_{ij} over Q_i , we obtain that for any $(y, t) \in \Gamma(x)$ and for $i, j = 1, 2, \dots$,

$$\begin{aligned} |(\varphi_t * h_{ij})(y)| &= \left| \int_{Q_i} [\varphi_t(y - z) - \varphi_t(y - c_i)] h_{ij}(z) dz \right| \\ &\leq \int_{Q_i \cap \{z: |z-y| \leq t\}} \frac{|z - c_i|^\alpha}{t^{n+\alpha}} |h_{ij}(z)| dz \\ &\leq C \cdot \frac{\ell(Q_i)^\alpha}{t^{n+\alpha}} \int_{Q_i \cap \{z: |z-y| \leq t\}} |h_{ij}(z)| dz. \end{aligned} \quad (5.8)$$

In addition, for any $z \in Q_i$ and $x \in (Q_i^*)^c$, we have $|z - c_i| < \frac{|x - c_i|}{2}$. Thus, for all $(y, t) \in \Gamma(x)$ and $|z - y| \leq t$ with $z \in Q_i$, it is easy to see that

$$t + t \geq |x - y| + |y - z| \geq |x - z| \geq |x - c_i| - |z - c_i| \geq \frac{|x - c_i|}{2}. \quad (5.9)$$

Hence, for any $x \in (Q_i^*)^c$, by using the above inequalities (5.8) and (5.9) along with the fact that $\|h_{ij}\|_{L^1} \leq 2 \int_{Q_i} |f_j(x)| dx$, we obtain that for any $i, j = 1, 2, \dots$,

$$\begin{aligned} |\mathcal{S}_\alpha(h_{ij})(x)| &= \left(\iint_{\Gamma(x)} \left(\sup_{\varphi \in \mathcal{C}_\alpha} |(\varphi_t * h_{ij})(y)| \right)^2 \frac{dy dt}{t^{n+1}} \right)^{1/2} \\ &\leq C \cdot \ell(Q_i)^\alpha \left(\int_{Q_i} |h_{ij}(z)| dz \right) \left(\int_{\frac{|x-c_i|}{4}}^\infty \int_{|y-x| < t} \frac{dy dt}{t^{2(n+\alpha)+n+1}} \right)^{1/2} \\ &\leq C \cdot \ell(Q_i)^\alpha \left(\int_{Q_i} |h_{ij}(z)| dz \right) \left(\int_{\frac{|x-c_i|}{4}}^\infty \frac{dt}{t^{2(n+\alpha)+1}} \right)^{1/2} \end{aligned}$$

$$\leq C \cdot \frac{\ell(Q_i)^\alpha}{|x - c_i|^{n+\alpha}} \left(\int_{Q_i} |f_j(z)| dz \right).$$

Furthermore, by duality and Cauchy–Schwarz inequality again,

$$\left(\sum_j |\mathcal{S}_\alpha(h_{ij})(x)|^2 \right)^{1/2} \leq C \cdot \frac{\ell(Q_i)^\alpha}{|x - c_i|^{n+\alpha}} \times \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz.$$

Since $Q_i^* = 2\sqrt{n}Q_i \supset 2Q_i$, then $(Q_i^*)^c \subset (2Q_i)^c$. This fact together with the above pointwise estimate yields

$$\begin{aligned} K_5 &\leq \frac{C}{\sigma} \sum_i \left(\ell(Q_i)^\alpha \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \int_{(Q_i^*)^c} |b(x) - b_{Q_i}| \cdot \frac{w(x)}{|x - c_i|^{n+\alpha}} dx \right) \\ &\leq \frac{C}{\sigma} \sum_i \left(\ell(Q_i)^\alpha \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \int_{(2Q_i)^c} |b(x) - b_{Q_i}| \cdot \frac{w(x)}{|x - c_i|^{n+\alpha}} dx \right) \\ &\leq \frac{C}{\sigma} \sum_i \left(\ell(Q_i)^\alpha \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \sum_{l=1}^{\infty} \int_{2^{l+1}Q_i \setminus 2^l Q_i} |b(x) - b_{2^{l+1}Q_i}| \cdot \frac{w(x)}{|x - c_i|^{n+\alpha}} dx \right) \\ &\quad + \frac{C}{\sigma} \sum_i \left(\ell(Q_i)^\alpha \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \sum_{l=1}^{\infty} \int_{2^{l+1}Q_i \setminus 2^l Q_i} |b_{2^{l+1}Q_i} - b_{Q_i}| \cdot \frac{w(x)}{|x - c_i|^{n+\alpha}} dx \right) \\ &:= \text{I} + \text{II}. \end{aligned}$$

For the term I, it then follows from (4.6)(consider $2^{l+1}Q_i$ instead of B), (2.2) and the fact that $w \in A_1$,

$$\begin{aligned} \text{I} &\leq \frac{C}{\sigma} \sum_i \left(\ell(Q_i)^\alpha \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \sum_{l=1}^{\infty} \frac{1}{[2^{l-1}\ell(Q_i)]^{n+\alpha}} \int_{2^{l+1}Q_i} |b(x) - b_{2^{l+1}Q_i}| \cdot w(x) dx \right) \\ &\leq \frac{C \cdot \|b\|_*}{\sigma} \sum_i \left(\int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \sum_{l=1}^{\infty} \frac{w(2^{l+1}Q_i)}{(2^{l-1})^{n+\alpha}|Q_i|} \right) \\ &\leq \frac{C \cdot \|b\|_*}{\sigma} \sum_i \left(\int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \sum_{l=1}^{\infty} \frac{(2^{l+1})^n w(Q_i)}{(2^{l-1})^{n+\alpha}|Q_i|} \right) \\ &\leq \frac{C}{\sigma} \sum_i \left(\frac{w(Q_i)}{|Q_i|} \cdot \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \sum_{l=1}^{\infty} \frac{1}{2^{l\alpha}} \right) \\ &\leq \frac{C}{\sigma} \sum_i \operatorname{ess\,inf}_{z \in Q_i} w(z) \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \end{aligned}$$

$$\begin{aligned}
&\leq \frac{C}{\sigma} \int_{\bigcup_i Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} w(z) dz \\
&\leq C \int_{\mathbb{R}^n} \frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma} \cdot w(z) dz \leq C \int_{\mathbb{R}^n} \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma}\right) \cdot w(z) dz.
\end{aligned}$$

For the term II, from the inequalities (4.4) and (2.2) along with the fact that $w \in A_1$, it then follows that

$$\begin{aligned}
\Pi &\leq \frac{C \cdot \|b\|_*}{\sigma} \sum_i \left(\ell(Q_i)^\alpha \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \sum_{l=1}^{\infty} (l+1) \cdot \frac{w(2^{l+1}Q_i)}{[2^{l-1}\ell(Q_i)]^{n+\alpha}} \right) \\
&\leq \frac{C \cdot \|b\|_*}{\sigma} \sum_i \left(\int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \sum_{l=1}^{\infty} (l+1) \cdot \frac{(2^{l+1})^n w(Q_i)}{(2^{l-1})^{n+\alpha} |Q_i|} \right) \\
&\leq \frac{C}{\sigma} \sum_i \left(\frac{w(Q_i)}{|Q_i|} \cdot \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \times \sum_{l=1}^{\infty} \frac{l+1}{2^{l\alpha}} \right) \\
&\leq \frac{C}{\sigma} \sum_i \left(\frac{w(Q_i)}{|Q_i|} \cdot \int_{Q_i} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \right) \leq C \int_{\mathbb{R}^n} \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma}\right) \cdot w(z) dz.
\end{aligned}$$

On the other hand, by using the weighted weak-type (1,1) estimate of vector-valued intrinsic square functions (see Theorem B) and (5.7), we have

$$\begin{aligned}
K_6 &\leq \frac{C}{\sigma} \int_{\mathbb{R}^n} \left(\sum_j \left| \sum_i |b(x) - b_{Q_i}| |h_{ij}(x)| \right|^2 \right)^{1/2} w(x) dx \\
&\leq \frac{C}{\sigma} \int_{\mathbb{R}^n} \sum_i |b(x) - b_{Q_i}| \left(\sum_j |h_{ij}(x)|^2 \right)^{1/2} w(x) dx \\
&= \frac{C}{\sigma} \sum_i \int_{Q_i} |b(x) - b_{Q_i}| \left(\sum_j |h_{ij}(x)|^2 \right)^{1/2} w(x) dx \\
&\leq \frac{C}{\sigma} \sum_i \int_{Q_i} |b(x) - b_{Q_i}| \left(\sum_j |f_j(x)|^2 \right)^{1/2} w(x) dx \\
&\quad + \frac{C}{\sigma} \sum_i \frac{1}{|Q_i|} \int_{Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} dy \times \int_{Q_i} |b(x) - b_{Q_i}| w(x) dx \\
&:= \text{III} + \text{IV}.
\end{aligned}$$

For the term III, by the generalized Hölder's inequality with weight (2.6), (2.7) and (2.5), we can deduce that

$$\text{III} = \frac{C}{\sigma} \sum_i w(Q_i) \cdot \frac{1}{w(Q_i)} \int_{Q_i} |b(x) - b_{Q_i}| \left(\sum_j |f_j(x)|^2 \right)^{1/2} w(x) dx$$

$$\begin{aligned}
&\leq \frac{C}{\sigma} \sum_i w(Q_i) \cdot \|b - b_{Q_i}\|_{\exp L(w), Q_i} \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L \log L(w), Q_i} \\
&\leq \frac{C \cdot \|b\|_*}{\sigma} \sum_i w(Q_i) \cdot \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L \log L(w), Q_i} \\
&\leq \frac{C \cdot \|b\|_*}{\sigma} \sum_i w(Q_i) \cdot \inf_{\eta > 0} \left\{ \eta + \frac{\eta}{w(Q_i)} \int_{Q_i} \Phi \left(\frac{\|\vec{f}(y)\|_{\ell^2}}{\eta} \right) \cdot w(y) dy \right\} \\
&\leq \frac{C \cdot \|b\|_*}{\sigma} \sum_i w(Q_i) \cdot \left\{ \sigma + \frac{\sigma}{w(Q_i)} \int_{Q_i} \Phi \left(\frac{\|\vec{f}(y)\|_{\ell^2}}{\sigma} \right) \cdot w(y) dy \right\} \\
&\leq C \left\{ \sum_i w(Q_i) + \sum_i \int_{Q_i} \Phi \left(\frac{\|\vec{f}(y)\|_{\ell^2}}{\sigma} \right) \cdot w(y) dy \right\} \\
&\leq C \int_{\mathbb{R}^n} \Phi \left(\frac{\|\vec{f}(y)\|_{\ell^2}}{\sigma} \right) \cdot w(y) dy.
\end{aligned}$$

For the term IV, by the inequality (4.6)(consider Q_i instead of B) and the fact that $w \in A_1$, we conclude that

$$\begin{aligned}
\text{IV} &\leq \frac{C \cdot \|b\|_*}{\sigma} \sum_i \frac{w(Q_i)}{|Q_i|} \int_{Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} dy \\
&\leq \frac{C \cdot \|b\|_*}{\sigma} \sum_i \int_{Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} w(y) dy \\
&\leq \frac{C \cdot \|b\|_*}{\sigma} \int_{\bigcup_i Q_i} \left(\sum_j |f_j(y)|^2 \right)^{1/2} w(y) dy \\
&\leq C \int_{\mathbb{R}^n} \frac{\|\vec{f}(y)\|_{\ell^2}}{\sigma} \cdot w(y) dy \leq C \int_{\mathbb{R}^n} \Phi \left(\frac{\|\vec{f}(y)\|_{\ell^2}}{\sigma} \right) \cdot w(y) dy.
\end{aligned}$$

Summing up all the above estimates, we get the desired result. $\square$

6 Proof of Theorem 2.5

Proof. Fix a ball $B = B(x_0, r_B) \subseteq \mathbb{R}^n$ and decompose $f_j = f_j^0 + f_j^\infty$, where $f_j^0 = f_j \cdot \chi_{2B}$ and χ_{2B} denotes the characteristic function of $2B = B(x_0, 2r_B)$, $j = 1, 2, \dots$. For any $0 \leq \kappa < 1$, $w \in A_1$ and any given $\sigma > 0$, we then write

$$\begin{aligned}
&\frac{1}{\theta(w(B))} \cdot w \left(\left\{ x \in B : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2 \right)^{1/2} > \sigma \right\} \right) \\
&\leq \frac{1}{\theta(w(B))} \cdot w \left(\left\{ x \in B : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j^0)(x)|^2 \right)^{1/2} > \sigma/2 \right\} \right)
\end{aligned}$$

$$+ \frac{1}{\theta(w(B))} \cdot w \left(\left\{ x \in B : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j^\infty)(x)|^2 \right)^{1/2} > \sigma/2 \right\} \right)$$

$$:= K'_1 + K'_2.$$

By using Theorem 2.4, we get

$$\begin{aligned} K'_1 &\leq C \cdot \frac{1}{\theta(w(B))} \int_{\mathbb{R}^n} \Phi \left(\frac{1}{\sigma} \left(\sum_j |f_j^0(x)|^2 \right)^{1/2} \right) \cdot w(x) dx \\ &= C \cdot \frac{1}{\theta(w(B))} \int_{2B} \Phi \left(\frac{1}{\sigma} \left(\sum_j |f_j(x)|^2 \right)^{1/2} \right) \cdot w(x) dx \\ &= C \cdot \frac{\theta(w(2B))}{\theta(w(B))} \cdot \frac{1}{\theta(w(2B))} \int_{2B} \Phi \left(\frac{1}{\sigma} \left(\sum_j |f_j(x)|^2 \right)^{1/2} \right) \cdot w(x) dx. \end{aligned}$$

Observe that

$$\frac{1}{\theta(w(B))} \leq \frac{1 + \log^+ \left(\frac{w(B)}{\theta(w(B))} \right)}{\theta(w(B))} = \frac{\Phi \left(\frac{w(B)}{\theta(w(B))} \right)}{w(B)}. \quad (6.1)$$

Moreover, since $0 < w(B) < w(2B) < +\infty$ when $w \in A_1$, then by the $\mathcal{D}_\kappa$ condition (2.9) of θ , the inequality (2.1) and the fact (6.1), we have

$$\begin{aligned} K'_1 &\leq C \cdot \frac{w(2B)^\kappa}{w(B)^\kappa} \cdot \frac{1}{\theta(w(2B))} \int_{2B} \Phi \left(\frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma} \right) \cdot w(x) dx \\ &\leq C \cdot \sup_B \left\{ \frac{1}{\theta(w(B))} \int_B \Phi \left(\frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma} \right) \cdot w(x) dx \right\} \\ &\leq C \cdot \sup_B \left\{ \frac{\Phi \left(\frac{w(B)}{\theta(w(B))} \right)}{w(B)} \int_B \Phi \left(\frac{\|\vec{f}(x)\|_{\ell^2}}{\sigma} \right) \cdot w(x) dx \right\}. \end{aligned}$$

Recall that the following pointwise estimate holds for any $x \in B$,

$$\begin{aligned} \left(\sum_j |[b, \mathcal{S}_\alpha](f_j^\infty)(x)|^2 \right)^{1/2} &\leq |b(x) - b_B| \left(\sum_j |\mathcal{S}_\alpha(f_j^\infty)(x)|^2 \right)^{1/2} \\ &\quad + \left(\sum_j |\mathcal{S}_\alpha([b_B - b]f_j^\infty)(x)|^2 \right)^{1/2}. \end{aligned}$$

So we can divide the term K'_2 into two parts.

$$\begin{aligned} K'_2 &\leq \frac{1}{\theta(w(B))} \cdot w \left(\left\{ x \in B : |b(x) - b_B| \cdot \left(\sum_j |\mathcal{S}_\alpha(f_j^\infty)(x)|^2 \right)^{1/2} > \sigma/4 \right\} \right) \\ &\quad + \frac{1}{\theta(w(B))} \cdot w \left(\left\{ x \in B : \left(\sum_j |\mathcal{S}_\alpha([b_B - b]f_j^\infty)(x)|^2 \right)^{1/2} > \sigma/4 \right\} \right) \\ &:= K'_3 + K'_4. \end{aligned}$$

Since $w \in A_1$, then there exists a number $r > 1$ such that $w \in RH_r$. Hence, by using the previous pointwise estimate (3.3), Chebyshev's inequality together with Hölder's inequality and John–Nirenberg's inequality (see [5]), we conclude that

$$\begin{aligned}
K'_3 &\leq \frac{1}{\theta(w(B))} \cdot \frac{4}{\sigma} \int_B |b(x) - b_B| \cdot \left(\sum_j |\mathcal{S}_\alpha(f_j^\infty)(x)|^2 \right)^{1/2} w(x) dx \\
&\leq C \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} \frac{1}{\sigma} \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \\
&\quad \times \frac{1}{\theta(w(B))} \cdot \left(\int_B |b(x) - b_B|^{r'} dx \right)^{1/r'} \left(\int_B w(x)^r dx \right)^{1/r} \\
&\leq C \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} \frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma} dz \times \frac{w(B)}{\theta(w(B))}.
\end{aligned}$$

It then follows from the A_1 condition and the fact (6.1) that

$$\begin{aligned}
K'_3 &\leq C \sum_{l=1}^{\infty} \frac{1}{w(2^{l+1}B)} \int_{2^{l+1}B} \frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma} \cdot w(z) dz \times \frac{w(B)}{\theta(w(B))} \\
&= C \sum_{l=1}^{\infty} \frac{1}{\theta(w(2^{l+1}B))} \cdot \frac{\theta(w(2^{l+1}B))}{w(2^{l+1}B)} \int_{2^{l+1}B} \frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma} \cdot w(z) dz \times \frac{w(B)}{\theta(w(B))} \\
&\leq C \cdot \sup_B \left\{ \frac{\Phi\left(\frac{w(B)}{\theta(w(B))}\right)}{w(B)} \int_B \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma}\right) \cdot w(z) dz \right\} \\
&\quad \times \sum_{l=1}^{\infty} \frac{\theta(w(2^{l+1}B))}{\theta(w(B))} \cdot \frac{w(B)}{w(2^{l+1}B)}.
\end{aligned}$$

Substituting the previous inequality (3.7) into the term K'_3 , we thus obtain

$$K'_3 \leq C \cdot \sup_B \left\{ \frac{\Phi\left(\frac{w(B)}{\theta(w(B))}\right)}{w(B)} \int_B \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma}\right) \cdot w(z) dz \right\}.$$

On the other hand, applying the previous pointwise estimate (4.2) and Chebyshev's inequality, we have

$$\begin{aligned}
K'_4 &\leq \frac{1}{\theta(w(B))} \cdot \frac{4}{\sigma} \int_B \left(\sum_j |\mathcal{S}_\alpha([b_B - b]f_j^\infty)(x)|^2 \right)^{1/2} w(x) dx \\
&\leq \frac{w(B)}{\theta(w(B))} \cdot \frac{C}{\sigma} \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} |b(z) - b_B| \cdot \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz
\end{aligned}$$

$$\begin{aligned}
&\leq \frac{w(B)}{\theta(w(B))} \cdot \frac{C}{\sigma} \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} |b(z) - b_{2^{l+1}B}| \cdot \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \\
&+ \frac{w(B)}{\theta(w(B))} \cdot \frac{C}{\sigma} \sum_{l=1}^{\infty} \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} |b_{2^{l+1}B} - b_B| \cdot \left(\sum_j |f_j(z)|^2 \right)^{1/2} dz \\
&:= K'_5 + K'_6.
\end{aligned}$$

For the term K'_5 , we first use the generalized Hölder's inequality with weight (2.6), (2.7) and (2.5) together with the A_1 condition to obtain

$$\begin{aligned}
K'_5 &\leq \frac{C}{\sigma} \cdot \frac{w(B)}{\theta(w(B))} \sum_{l=1}^{\infty} \frac{1}{w(2^{l+1}B)} \int_{2^{l+1}B} |b(z) - b_{2^{l+1}B}| \cdot \left(\sum_j |f_j(z)|^2 \right)^{1/2} w(z) dz \\
&\leq \frac{C}{\sigma} \cdot \frac{w(B)}{\theta(w(B))} \sum_{l=1}^{\infty} \|b - b_{2^{l+1}B}\|_{\exp L(w), 2^{l+1}B} \left\| \left(\sum_j |f_j|^2 \right)^{1/2} \right\|_{L \log L(w), 2^{l+1}B} \\
&\leq \frac{C\|b\|_*}{\sigma} \cdot \frac{w(B)}{\theta(w(B))} \sum_{l=1}^{\infty} \inf_{\eta>0} \left\{ \eta + \frac{\eta}{w(2^{l+1}B)} \int_{2^{l+1}B} \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\eta}\right) \cdot w(z) dz \right\}.
\end{aligned}$$

Moreover, notice that the inequality $\Phi(a \cdot b) \leq \Phi(a) \cdot \Phi(b)$ holds for any $a, b > 0$, when $\Phi(t) = t \cdot (1 + \log^+ t)$. For $l = 1, 2, \dots$, we may choose $\eta = \frac{\sigma \cdot \theta(w(2^{l+1}B))}{w(2^{l+1}B)}$ and then use the estimate (3.7) to obtain

$$\begin{aligned}
K'_5 &\leq \frac{C\|b\|_*}{\sigma} \cdot \frac{w(B)}{\theta(w(B))} \\
&\times \sum_{l=1}^{\infty} \left\{ \sigma \cdot \frac{\theta(w(2^{l+1}B))}{w(2^{l+1}B)} + \frac{\sigma}{w(2^{l+1}B)} \cdot \frac{\theta(w(2^{l+1}B))}{w(2^{l+1}B)} \cdot \Phi\left(\frac{w(2^{l+1}B)}{\theta(w(2^{l+1}B))}\right) \int_{2^{l+1}B} \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma}\right) \cdot w(z) dz \right\} \\
&\leq C\|b\|_* \cdot \left[1 + \sup_B \left\{ \frac{\Phi\left(\frac{w(B)}{\theta(w(B))}\right)}{w(B)} \int_B \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma}\right) \cdot w(z) dz \right\} \right] \\
&\times \sum_{l=1}^{\infty} \frac{\theta(w(2^{l+1}B))}{\theta(w(B))} \cdot \frac{w(B)}{w(2^{l+1}B)} \\
&\leq C \cdot \sup_B \left\{ \frac{\Phi\left(\frac{w(B)}{\theta(w(B))}\right)}{w(B)} \int_B \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma}\right) \cdot w(z) dz \right\}.
\end{aligned}$$

For the last term K'_6 we proceed as follows. An application of the inequality (4.4) leads to that

$$\begin{aligned}
K'_6 &\leq C \cdot \frac{w(B)}{\theta(w(B))} \sum_{l=1}^{\infty} (l+1) \|b\|_* \cdot \frac{1}{|2^{l+1}B|} \int_{2^{l+1}B} \frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma} dz \\
&\leq C \cdot \frac{w(B)}{\theta(w(B))} \sum_{l=1}^{\infty} (l+1) \|b\|_* \cdot \frac{1}{w(2^{l+1}B)} \int_{2^{l+1}B} \frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma} \cdot w(z) dz
\end{aligned}$$

$$\begin{aligned} &\leq C \cdot \sup_B \left\{ \frac{\Phi\left(\frac{w(B)}{\theta(w(B))}\right)}{w(B)} \int_B \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma}\right) \cdot w(z) dz \right\} \\ &\times \sum_{l=1}^{\infty} (l+1) \cdot \frac{\theta(w(2^{l+1}B))}{\theta(w(B))} \cdot \frac{w(B)}{w(2^{l+1}B)}. \end{aligned}$$

Notice that $w \in A_1 \subset A_{\infty}$, by using the $\mathcal{D}_{\kappa}$ condition (2.9) of θ and the inequality (2.3) again together with the fact that $0 \leq \kappa < 1$, we thus have

$$\begin{aligned} \sum_{l=1}^{\infty} (l+1) \cdot \frac{\theta(w(2^{l+1}B))}{\theta(w(B))} \cdot \frac{w(B)}{w(2^{l+1}B)} &\leq C \sum_{l=1}^{\infty} (l+1) \cdot \frac{w(B)^{1-\kappa}}{w(2^{l+1}B)^{1-\kappa}} \\ &\leq C \sum_{l=1}^{\infty} (l+1) \cdot \left(\frac{|B|}{|2^{l+1}B|} \right)^{\delta^*(1-\kappa)} \\ &\leq C \sum_{l=1}^{\infty} (l+1) \cdot \left(\frac{1}{2^{(l+1)n}} \right)^{\delta^*(1-\kappa)} \\ &\leq C. \end{aligned} \tag{6.2}$$

Substituting the above inequality (6.2) into the term K'_6 , we finally obtain

$$K'_6 \leq C \cdot \sup_B \left\{ \frac{\Phi\left(\frac{w(B)}{\theta(w(B))}\right)}{w(B)} \int_B \Phi\left(\frac{\|\vec{f}(z)\|_{\ell^2}}{\sigma}\right) \cdot w(z) dz \right\}.$$

Summing up all the above estimates, we therefore conclude the proof of the main theorem. $\square$

Further remark. Let $p = 1$, $0 \leq \kappa < 1$, θ satisfy the $\mathcal{D}_{\kappa}$ condition (2.9) and w be a weight function on $\mathbb{R}^n$. We denote by $\mathcal{M}_{L \log L}^{1,\theta}(w)$ the generalized weighted Morrey space of $L \log L$ type, the space of all locally integrable functions f defined on $\mathbb{R}^n$ with finite norm $\|f\|_{\mathcal{M}_{L \log L}^{1,\theta}(w)}$.

$$\mathcal{M}_{L \log L}^{1,\theta}(w) := \left\{ f \in L_{loc}^1(w) : \|f\|_{\mathcal{M}_{L \log L}^{1,\theta}(w)} < \infty \right\},$$

where $\Phi(t) = t \cdot (1 + \log^+ t)$ and

$$\|f\|_{\mathcal{M}_{L \log L}^{1,\theta}(w)} := \sup_B \left\{ \frac{\Phi\left(\frac{w(B)}{\theta(w(B))}\right)}{w(B)} \int_B |f(x)| w(x) dx \right\},$$

or

$$\|f\|_{\mathcal{M}_{L \log L}^{1,\theta}(w)} := \sup_B \left\{ \frac{1 + \log^+ \left(\frac{w(B)}{\theta(w(B))} \right)}{\theta(w(B))} \int_B |f(x)| w(x) dx \right\}.$$

Obviously, we have $\mathcal{M}^{1,\theta}(w) \supseteq \mathcal{M}_{L \log L}^{1,\theta}(w)$ by the definition. Then the corresponding estimate in Theorem 2.5 reads

$$\frac{1}{\theta(w(B))} \cdot w\left(\left\{x \in B : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2\right)^{1/2} > \sigma\right\}\right) \leq C \cdot \left\|\Phi\left(\frac{\|\vec{f}\|_{\ell^2}}{\sigma}\right)\right\|_{\mathcal{M}_{L \log L}^{1,\theta}(w)}.$$

Roughly speaking, we can say that the vector-valued commutator generated with BMO function is bounded from $\mathcal{M}_{L \log L}^{1,\theta}(w)$ to $W\mathcal{M}^{1,\theta}(w)$ from the above definitions. In comparison with the conclusions of Theorems 2.4 and 2.5, it is natural to ask the question whether or not this vector-valued commutator has a more refined estimate:

$$\frac{1}{\theta(w(B))} \cdot w\left(\left\{x \in B : \left(\sum_j |[b, \mathcal{S}_\alpha](f_j)(x)|^2\right)^{1/2} > \sigma\right\}\right) \leq C \cdot \left\|\Phi\left(\frac{\|\vec{f}\|_{\ell^2}}{\sigma}\right)\right\|_{\mathcal{M}^{1,\theta}(w)}.$$

By the technique used in this article, there is an “extra” $\log^+(\cdot)$ term in the estimation of K'_5 . Whether this term can be removed is not known in general.
